

ABSTRACT

An easily adjusted skateboard shoe comprises a front seat, a rear seat and a buckle structure for connecting the front seat and the rear seat.

5 The buckle structure is formed by a round lower cover, a buckle, and a teeth bank. An upper side of the lower cover has a confining seat and the confining seat has guide grooves at two sides thereof. Thereby, the buckle moves straightly along the guide grooves of the lower cover. One inner end of the buckle has an engaging teeth which protrudes downwards and extends inwards so that the engaging teeth is exactly engaged to the teeth bank at a lower end of the front seat. The user can press the buckle from a lateral side of the skateboard shoe so that the engaging teeth of the buckle separates from the teeth bank; and thus the size of the skateboard shoe is adjusted.
